

Wisdom & Chance TCG — Complete Clone Setup Instructions

For Setting Up an Exact Copy on a New Replit Personal Account

Prepared: March 16, 2026

OVERVIEW

This document tells you (or your AI agent) exactly how to recreate the Wisdom & Chance web app on a new Replit workspace. The web app serves as both the website AND the backend server for the mobile app.

What this app is:

- Full-stack Trading Card Game (React frontend + Express.js backend)
 - PostgreSQL database for all persistent data
 - WebSocket server for real-time multiplayer
 - JWT authentication for mobile app connectivity
 - Google/GitHub/email login via Replit Auth (OIDC)
 - AI-powered card art generation via Gemini
 - PWA (Progressive Web App) for mobile browser
-

BEFORE YOU START — GET YOUR FILES READY

You need two things before setting up the new workspace:

1. The ZIP file (contains all code + database backup):

- In your CURRENT Replit workspace, click the three-dot menu ("⋮") at the top of the file panel on the left sidebar
- Select "Download as ZIP" — this downloads the entire project
- OR go to <https://github.com/redeagle28089-maker/Wisdom-and-Chance> ! click green "Code" button ! "Download ZIP"
- The ZIP includes a backups/ folder with SQL database dumps — this is how your data transfers to the new workspace

2. This PDF (the instructions you're reading right now)

Give BOTH the ZIP file and this PDF to the AI agent in your new workspace.

IMPORTANT: THE ZIP CONTAINS YOUR CODE BUT NOT A LIVE DATABASE

The ZIP file has everything: all source code, config files, and a backups/ folder with SQL dump files. However, the database itself does NOT transfer — it stays in the old workspace. The SQL dump files in backups/ are a complete snapshot of all your data (users, cards, card artwork, decks, ratings, achievements, friends, etc.). Step 4 below shows how to restore this data into the new database.

STEP-BY-STEP SETUP INSTRUCTIONS

STEP 1: Import the Code

Option A — From ZIP file (if you downloaded from Replit):

1. In your new Replit personal account, click "Create Repl"
2. Choose a blank Node.js template
3. Upload all files from the ZIP into the workspace (drag and drop or use the upload button)

Option B — From GitHub:

1. In your new Replit account, click "Create Repl"
 2. Choose "Import from GitHub"
 3. Paste: <https://github.com/redeagle28089-maker/Wisdom-and-Chance>
 4. Set language to Node.js
 5. Click Import
-

STEP 2: Install Dependencies

Run in the Shell:

```
npm install
```

This will install all packages listed in package.json. If any packages fail, the AI agent should check package.json and install them individually.

STEP 3: Set Up PostgreSQL Database

1. In Replit, go to the "Database" tab in the left sidebar
2. Create a new PostgreSQL database — Replit will automatically set the DATABASE_URL environment variable
3. After the database is created, run in the Shell:

```
npm run db:push
```

This creates all the database tables from the Drizzle schema.

STEP 4: Restore Database Data from the SQL Backup

THIS IS THE MOST CRITICAL STEP — without this, you lose ALL game data

The ZIP file includes a backups/ folder containing SQL dump files. These files are a complete snapshot of the database from the original workspace — they contain ALL data: user accounts, card artwork (stored as base64 images), saved decks, friend lists, ratings, achievements, leaderboard data, and everything else.

The database does NOT transfer between Replit workspaces automatically. Only the code transfers via ZIP/GitHub. You MUST restore the backup to get the data.

Step 4a: Find the backup file

List the backup files to find the most recent one:

```
ls -lh backups/*.sql
```

The most recent file is: backups/full-backup-20260316-005942.sql (about 12MB — large because it contains all card artwork images as base64 data).

Step 4b: Drop any empty tables created by Step 3

Since Step 3 created empty tables, and the backup file will try to create the same tables with data, you need to clear them first:

```
psql $DATABASE_URL -c "DROP SCHEMA public CASCADE; CREATE SCHEMA public;"
```

Step 4c: Restore the backup

```
psql $DATABASE_URL < backups/full-backup-20260316-005942.sql
```

This will take a minute or two because of the image data. You may see some notices — those are fine. Watch for actual ERROR messages.

Step 4d: Verify the data loaded correctly

Run these commands to confirm data is present:

```
psql $DATABASE_URL -c "SELECT COUNT(*) FROM users;"
psql $DATABASE_URL -c "SELECT COUNT(*) FROM card_images;"
psql $DATABASE_URL -c "SELECT COUNT(*) FROM card_image_mappings;"
psql $DATABASE_URL -c "SELECT COUNT(*) FROM player_stats;"
```

You should see non-zero counts. If any table returns 0 or an error, the restore did not work — try running Step 4b and 4c again.

Step 4e: If the SQL restore fails entirely

If psql is not available or the SQL file won't restore, there is a fallback:

- 1. Start the app (Step 7) — it will create empty tables
- 2. From the OLD workspace (if still accessible), visit: [https://\[old-app-url\]/api/admin/database-export?save=true](https://[old-app-url]/api/admin/database-export?save=true)
- 3. This produces a JSON export. The AI agent can use this to write import scripts
- 4. But the SQL dump method above is strongly preferred — it's a complete, exact copy

STEP 5: Set Up Environment Secrets

In Replit, go to the "Secrets" tab (lock icon) and add these:

Secret Name	Value	Notes
<code>`SESSION_SECRET`</code>	Generate a random 64-character string	Used for session cookies and JWT signing. Run <code>`node -e "console.log(require('crypto').randomBytes(32).toString('hex'))"`</code> to generate one
<code>`DATABASE_URL`</code>	(auto-set by Replit)	Already set when you created the PostgreSQL database

Replit auto-provides these (do NOT set manually)

- REPL_ID — Replit sets this automatically
- PORT — defaults to 5000
- REPLIT_DOMAINS — auto-set
- REPLIT_DEPLOYMENT — auto-set in production

STEP 6: Set Up Replit Integrations

The app uses two Replit integrations that must be installed in the new workspace:

- 1. Log In with Replit (Auth) — javascript_log_in_with_replit
 - This provides Google/GitHub/email authentication
 - Install from Replit's Integrations panel

- The code is already in server/replit_integrations/auth/
2. Gemini AI Integration — javascript_gemini_ai_integrations
- This provides the AI for card art generation and deck suggestions
 - Install from Replit's Integrations panel
 - It auto-sets AI_INTEGRATIONS_GEMINI_API_KEY and AI_INTEGRATIONS_GEMINI_BASE_URL
 - The code is already in server/replit_integrations/chat/, server/replit_integrations/image/, server/replit_integrations/batch/
-

STEP 7: Configure the Workflow

Create a workflow called "Start application" with this command:

```
npm run dev
```

This starts the Express server on port 5000, which serves both the API backend and the React frontend via Vite.

STEP 8: Verify the App Works

1. Start the workflow
 2. Check the console for:
 - WebSocket server initialized on /ws
 - serving on port 5000
 - OIDC pre-warming complete
 3. Open the preview URL — you should see the Wisdom & Chance login page
 4. Test login with Google/email
 5. Check the card database page loads with all cards
 6. Check admin access works (login with redeagle28089@gmail.com)
-

STEP 9: Deploy / Publish

1. Click "Publish" or "Deploy" in Replit
 2. The app will get a new public URL like your-app-name.replit.app
 3. IMPORTANT: Note this new URL — the mobile app needs to be updated to point to it
-

STEP 10: Connect to GitHub

Link to: <https://github.com/redeagle28089-maker/wisdom-and-chance-web>

Or create a new repo and push:

```
git remote add origin https://github.com/redeagle28089-maker/wisdom-and-chance-web.git
git branch -M main
git push -u origin main
```

UPDATING THE MOBILE APP

After the web app is deployed with a new URL, the mobile app needs to point to it.

Tell the mobile app AI:

"Update the server URL from `wisdom-and-chance.replit.app` to `[YOUR-NEW-URL].replit.app` everywhere in the codebase. This includes API calls, WebSocket connections, and image URLs."

Key files in the mobile app that reference the server URL:

- API client/service files (base URL for all HTTP requests)
- WebSocket connection setup (wss:// URL)
- Image loading (card art URLs)

DATABASE TABLES REFERENCE

Table	Purpose
`users`	User accounts (id, email, name, profile image)
`sessions`	Active login sessions

`user_decks`	Saved deck configurations
`friend_requests`	Pending friend requests
`friendships`	Confirmed friendships
`friend_messages`	Direct messages between friends (24hr expiry)
`game_rooms`	Multiplayer room state
`room_spectators`	Spectators in game rooms
`chat_messages`	In-game and room chat
`player_ratings`	ELO ratings and ranked stats
`player_stats`	XP, level, game counts, streaks
`achievements`	Achievement definitions
`player_achievements`	Player achievement progress
`daily_challenges`	Daily challenge definitions
`player_challenges`	Player challenge progress
`deck_codes`	Shareable deck codes
`card_images`	AI-generated card artwork (base64)
`card_image_mappings`	Which artwork is assigned to which card
`commander_image_mappings`	Which artwork is assigned to which commander
`user_presence`	Online/offline/in-game status
`matchmaking_queue`	Ranked matchmaking queue

ENVIRONMENT VARIABLES SUMMARY

Variable	Source	Required	Purpose
`DATABASE_URL`	Replit PostgreSQL	Yes	Database connection string
`SESSION_SECRET`	Manual (Secrets tab)	Yes	Session cookies + JWT signing
`REPL_ID`	Auto (Replit)	Yes	OIDC client ID for auth
`REPLIT_DOMAINS`	Auto (Replit)	Yes	Domain for cookie/redirect config
`REPLIT_DEPLOYMENT`	Auto (Replit)	No	"1" when deployed, controls production mode
`PORT`	Auto/Default	No	Server port (defaults to 5000)
`AI_INTEGRATIONS_GEMINI_API_KEY`	Replit Integration	No	Gemini AI for card art (admin only)
`AI_INTEGRATIONS_GEMINI_BASE_URL`	Replit Integration	No	Gemini AI base URL

ADMIN ACCESS

- Admin email: redeagle28089@gmail.com
- Admin sync code: 4838
- Admin check is hardcoded in server/routes.ts (search for ADMIN_EMAIL)
- Admin features: card art generation, card stat editing, image management, user management, database export, force-add friends

KEY API ENDPOINTS FOR MOBILE

Endpoint	Method	Auth	Purpose
`/api/mobile/auth/login`	POST	None	Mobile login (email -> JWT)
`/api/mobile/auth/refresh`	POST	Bearer	Refresh JWT token
`/api/mobile/auth/me`	GET	Bearer	Get current user

<code>/api/cards`</code>	GET	Any	List all cards
<code>/api/commanders`</code>	GET	Any	List all commanders
<code>/api/cards/:id/image`</code>	GET	Bearer	Download card artwork
<code>/api/commanders/:id/image`</code>	GET	Bearer	Download commander artwork
<code>/api/user-decks`</code>	GET	Bearer	List user's decks
<code>/api/rooms`</code>	GET	Bearer	List game rooms
<code>/api/friends`</code>	GET	Bearer	List friends
<code>/api/leaderboard`</code>	GET	Any	Ranked leaderboard
<code>/api/admin/sync?code=4838`</code>	GET	None	Full data sync for mobile
<code>/api/admin/database-export`</code>	GET	Admin	Export all database tables
<code>/ws?token=<jwt>`</code>	WebSocket	Bearer	Real-time multiplayer

TROUBLESHOOTING

"Cannot find module" errors:

- Run npm install

Database connection errors:

- Make sure PostgreSQL is provisioned in Replit
- Check that DATABASE_URL is set in Secrets

Auth not working (login redirects fail):

- Install the "Log In with Replit" integration
- Make sure REPL_ID is auto-set (it should be)
- Make sure SESSION_SECRET is set in Secrets

Card images not showing:

- Restore the database backup (images are stored as base64 in the card_images table)
- Run the app and check admin panel -> Image Database

Gemini AI features not working:

- Install the "Gemini AI" Replit integration
- This is only needed for admin card art generation — the app works fine without it

WebSocket connection fails:

- Make sure the app is deployed (WebSocket needs the public URL)
- Mobile connects via `wss://your-app.replit.app/ws?token=<jwt>`

End of Clone Setup Instructions — Wisdom & Chance TCG v2.2.0
